

Getting Started

First Steps

Getting started with FastManager basically involves the following steps:

1. Create or select a location to be the "FastManager Data Folder"
2. Install the program on the first computer
3. Register the computer
4. Create the company database (in the folder you selected during Step 1)
5. Install FastManager on the other computers and connect them to the company database

You can immediately start creating orders using the built-in pricelists while changing prices on the fly. Or you can spend some time creating [your own pricing](#)

After you have created your company database using the default database backend, you have the option of upgrading the database to use the SQL Backend.
